DataThread

Track your users *and* your data.

As threats to data security grow, governments and trade groups are adopting strict standards to ensure protection of sensitive data, much of which is stored on Power Systems™ running IBM i. Finance, biotech-nology, gaming, and other highly regulated industries rely on the operating system to secure their data and track it for compliance audits.

PowerTech DataThread™ leverages IBM i to automate, streamline, and centralize your database monitoring while providing full notification, authorization, reporting, and regulatory compliance capabilities.

Know What Your Users Are Doing

DataThread is a high-performance database monitor that helps you automate and centralize monitoring and user activity reporting for your IBM i servers. When a user accesses a database file, DataThread tracks what they see, where they go, and what they do, including changes they make to sensitive information like payroll files.

Providing a complete audit trail and real-time notification, DataThread helps you meet compliance requirements and reduce security risks.

Automate and Centralize Your Monitoring

DataThread automates and centralizes your monitoring and reporting (even down to field-level). It allows you to process by exception and eliminate manual reporting and reviewing. You can even use e-signatures and notifications to automate your approval processes and streamline your workflow.

DataThread empowers your change review with real-time monitor-ing and the ability to sign for changes.

A constant influx of unfiltered data changes does no good if there's too much to understand. DataThread filters events by user, IP address, date, time, and priority so operators have less volume and can read results more easily.

Leveraging IBM i to automate, streamline, and centralize your database monitoring.

Empower Your Change Review

DataThread detects database changes in real time. It also gives data owners power to require permission for changes and review whether changes were approved. The result is an audit trail with visibility to all changes and a record of historical reporting and forensics.

DataThread also generates reports and secures audit history, with custom options—you can designate certain fields to be more sensitive than others—for sending automatic alerts by email, text, or pager.

Meet Security Regulations and Standards

It is more crucial than ever to comply with government and trade mandates for integrity and security of data. DataThread captures changes in a secure, auditable database—including before-and-after images and change history—giving you the ability to satisfy audits with confidence and without the suspicion that homemade controls arouse.

DataThread captures data changes in a secure, auditable database, including before and after images of changed data

Enjoy a Quick Return on Investment

Regulations can place a large burden on IT resources. DataThread lessens the impact by helping you satisfy data integrity and audit requirements without programming or modifying your applications. It offers quick and continuing payoff by extending the capabilities of your existing systems—including your file journal—so you can monitor databases and send change notifications automatically and in real time.

About the PowerTech Group, Inc.

Because Power Systems servers are used to host particularly sensitive corporate data, every organization needs to practice proactive compliance security. As an IBM Advanced Business Partner with over 1,000 customers worldwide, PowerTech understands corporate vulnerability and the risks associated with data privacy and access control.
